

"Isabella" Directional Indicator Control

Bremen, 28.10.1959

When assembling or dismantling the self-cancelling directional indicator switch on the steering column of the Isabella, the following instructions should be observed:-

Dismantling

1. Undo clip holding electric cable to the steering column bearing support.
2. Unscrew retaining screws holding switch to steering column housing.
3. Remove self-cancelling switch from housing, at the same time feeding the electric lead and flexible sheath after it from below (see illustration).

Assembly

1. After connecting the electric leads, insert switch in steering column housing, drawing the electric cable and flexible sheath from below whilst so doing.

Important!

After connecting up the lead to the cable, check to ensure that the plastic tube reaches the switch. There must be no uncovered wire between the end of the tube and switch.

2. Screw indicator switch onto the steering column housing.
3. Re-secure electric lead in its flexible sheath to steering column bearing support by means of clip.

N.B.

The assembly instructions must be rigidly adhered to, to ensure that the electric leads inside the steering column housing are always completely protected by the flexible tube so that they are shielded against the possibility of chafing on the steering column and the subsequent danger of a short-circuit!
